

I. Amendments to the Claims

This listing of claims will replace all prior versions, and listings, of claims in the application:

A. Listing of Claims

1. (Currently Amended) A video recording/playback system for recording and playback of video data received, comprising:

~~storage means~~ a memory which receives and stores video data which consists of sets of main data and sub data falling under different categories, the sets of main data and sub data being associated and sequenced along time axis wherein in a set of main data and sub data an ID code and substitute data are embedded in advance, said ID code identifying said set of main data and sub data, said substitute data being associated with said sub data, and the same ID code as assigned to said main data is assigned to said sub data;

~~playback means~~ a playback unit which reads out main data and sub data from ~~the storage~~ means said memory and renders video contents of these data; and

~~control means~~ a controller which, when said main data stored in said memory is rendered, detects an ID code assigned to said main data, compares the detected ID code with an ID code assigned to said sub data stored in said memory and judges whether said sub data associated with said main data under rendering has already been read from said storage means memory and its video rendered and, unless said sub data video has been rendered, changes substitute data which has been associated in advance with said sub data and embedded in said main data into video data and when said main data is rendered incorporates said substitute data into said main data and makes video data associated with substitute data render embedded in said main data and associated in

advance with said sub data into video data and incorporates said substitute data into said main data and makes said video data render when said main data is rendered.

2. (Previously Presented) The video recording/playback system according to claim 1, wherein said main data is program data and said sub data is commercial data.

3. (Currently Amended) The video recording/playback system according to claim [[2]] 1, wherein said main data and said sub data include ~~an ID code which identifies the set of main data and sub data~~ and attribute data which indicates the attribute of said set of main data and sub data and said ~~control means~~ controller judges by said detected ID code and said attribute data whether said sub data has been rendered.

Claims 4-5 (Cancelled).

6. (Currently Amended) The video recording/playback system according to claim 5, wherein said main data includes substitute information rendering limit data for setting a limit to rendering said substitute ~~information~~ data.

7. (Currently Amended) The video recording/playback system according to claim 6, wherein said substitute information rendering limit data is specified so that said substitute ~~information data~~ data will be rendered in a certain range of frames of said main data associated with said sub data which has not been rendered.

8. (Currently Amended) The video recording/playback system according to claim 6, wherein, as said substitute information rendering limit data, the number of times said substitute ~~information~~

data is to be rendered or a time range within which said substitute ~~information~~ data is to be rendered are set.

Claim 9 (Cancelled).

10. (Currently Amended) The video recording/playback system according to claim 1, wherein said main data includes a substitute data address instead of said substitute data, the substitute data address specifying where the substitute data has been stored in advance on said ~~storage~~ ~~means~~ memory or another ~~storage~~ ~~means~~ memory on a network.

11. (Currently Amended) The video recording/playback system according to claim 1, wherein input of a cancel code for disabling the rendering of said substitute ~~information~~ data makes it impossible for said ~~control~~ ~~means~~ controller to incorporate said substitute data into said main data and render main video accompanied with said substitute ~~information~~ data.

12. (Currently Amended) The video recording/playback system according to claim 1, wherein said substitute ~~information~~ data is the name of an advertiser, a corporate logo, or a commodity name to advertise which substitutes for said sub data.

13. (Currently Amended) A method for generating video data, comprising the steps of:

~~arranging sets of main data and sub data falling under different categories in sequence~~
receiving video data which consists of sets of main data and sub data falling under different categories, said sets of main data and sub data being associated and sequenced along time axis wherein in a set of main data and sub data an ID code and substitute data are embedded in advance, said ID code identifying said set of main data and sub data, said substitute data being

associated with said sub data, and the same ID code as assigned to said main data is assigned to said sub data;

storing the received video data in a memory;

~~embedding an ID code, which is assigned to a set of main data and sub data, and attribute data indicating the attribute of said set of main data and sub data into said main data and said sub data in advance; and~~

~~embedding substitute data in said main data, wherein said substitute data is incorporated into said main data when said main data is rendered and its information is rendered accompanying said main data, unless said sub data is rendered by a device which received the video data~~

reading out said main data from said memory and rendering it;

wherein in the step of said rendering:

said ID code assigned to said main data is detected;

the detected ID code is compared with said ID code assigned to said sub data stored in said memory;

judging whether said sub data associated with said main data under rendering has already been read from said memory and its video rendered is executed according to the result of said comparing; and

unless said sub data video has been rendered, said substitute data embedded in said main data is changed into video data and said substitute data is incorporated into said main data.

14. (Previously Presented) The method for generating video data according to claim 13, wherein said main data is program data and said sub data is commercial data.

15. (Currently Amended) The method for generating video data according to claim ~~[[14]]~~ 13, wherein said main data and said sub data include ~~an ID code which identifies the set of main data and sub data and~~ attribute data which indicates the attribute of said set of main data and sub data and it is judged by said detected ID code and said attribute data whether said sub data has been rendered.

16. (Currently Amended) The method for generating video data according to claim ~~15~~ 13, wherein unless sub data with a same ID code as assigned to main data which is being rendered has been read out from said ~~storage means~~ memory and rendered, said substitute data associated in advance with said sub data which has not been rendered is incorporated into said main data and its information is rendered accompanying main video.

Claim 17 (Cancelled).
